

Assess. Execute. Optimize.

Your Network & Data

Secure, Available,
& Optimized

To meet your needs

Services Include:

- Security Technology Consulting
- Security Strategy and Policy Design
- Data and Information
- People and Identity
- Perimeter Security
- Application Security
- Intrusion Detection Systems
- Web Security Design
- E-Mail Security Design
- Vulnerability Assessment and Management
- Remote Monitoring and Management
- Industry and Regulatory Compliance

Today's Security Challenges

A new generation of interactive business communication and collaboration technologies provides tremendous productivity and flexibility gains for organizations of all kinds. This unprecedented connectivity also unleashes new, complex security risks.

We see significant changes in the threat landscape. No one predicted twelve months ago that spam volumes would level off, but they did. Although spam levels are still below their peak, it's not a question of *if* spam will return to previous levels, but rather *when* it will return. There is data regarding new zombie and botnet creation that suggest the time may not be too far in the future.

The creation of malicious websites is increasing, as are sites that host malware—with thousands of new sites appearing daily. Security solution providers are racing to keep up with the new forms of malware which are being created every day. Each new version of malware seems to up the ante and be more dangerous than previous versions.

Many receive lots of media attention, but many do not and, in fact, could be more dangerous than their more popular counterparts. Attackers know that the more relevant and in-context an attack is, the more likely a person is to take action such as clicking a link or entering data. With newer web technologies, we also see the use of current events and social networking sites to propagate threats to unsuspecting users.

Today's leaders face multiple challenges, including the need to innovate in extremely competitive conditions, address dynamic regulatory and compliance challenges, expedite returns on investments to counter shrinking IT budgets, and secure the enterprise against a barrage of new and evolving sophisticated threats. However, unlike other business challenges, organizations often take a technology-driven approach to securing their infrastructure when a business-driven approach that examines risk is more effective.

The Accunet Solutions team has deep expertise in the technologies and methodologies that comprise enterprise security strategies. We have designed and implemented hundreds of successful security solutions for major organizations, and we can do the same for you.

Business-driven approach to enterprise security

In the past, IT security relied on a perimeter-based approach, but in today's environment it's hard to define the perimeter. A service oriented infrastructure offers extraordinary flexibility and efficiency, but it forces you to re-think data security. It used to be that you could protect your data with a perimeter, but now you have to secure that data at rest and in motion. Organizations are looking for comprehensive capabilities for monitoring, access management, and encryption that can be integrated to help address information security across the enterprise. The Accunet business-driven approach to enterprise security helps you to address risk and reduce cost and complexity. This approach will help you:

- **identify gaps in your existing infrastructure including the people, processes, applications, data, technology and physical facilities**
- **prioritize security initiatives and investments for optimal return on investment**
- **execute an enterprise-wide security program by simplifying the planning and implementation of the plan**
- **provide a program that is repeatable and measureable which enables you to implement solutions and create a security roadmap that supports business competitiveness and growth**
- **reach a desired security level that meets business goals and regulatory requirements**

Accunet's focus on end-to-end security solutions across all risk areas allows you to create an intelligent infrastructure that drives down costs and effectively mitigate the risks to the confidentiality, integrity and availability of your Information Technology systems, and is as dynamic as today's business climate.

About Accunet

Founded in 1997, Accunet Solutions, Inc. (Accunet) is focused on providing advanced technology solutions through a multi-disciplined approach: Network Infrastructure; Enterprise Security; Enterprise Storage. We support all of our solutions with certified engineers that have a broad base of experience in working with large corporate IT environments as well as emerging companies' infrastructures.

Accunet is a leader in the technology industry. We invest in the systems, technology, and talent necessary to ensure your satisfaction and our continued success. That vision starts with the relationships we establish today. Our team is ready to come up with that solution for you.

Security Architecture and Integration services

To meet today's security challenges, businesses need both best-of-breed product capabilities and the ability to plan, design, integrate, and operate those solutions as an autonomous system.

Our solution partners provide the best-of-breed point technologies to address today's current and emerging threats. Our unique systems approach built on our security services and industry-leading product portfolio will help you to respond and prevent pervasive threats. This unique, comprehensive approach to information security is helping organizations improve IT security, reduce compliance risk, enforce business policies, and protect critical assets while lowering administrative burden and reducing total cost of ownership. Our solutions include:

- **Network Security Design Audit** - Review your existing network security infrastructure to identify architecture, design, and implementation issues and provide recommendations for new security solutions, improving, or reengineering your network security design
- **Data and Information Security Audit** - This assessment evaluates the primary data center technologies and components, including the storage network, servers, applications, core, distribution, access control, and host virtualization so you can fully utilize your data center equipment securely

Accunet's unique model leverages solutions, tools, methods and software to provide the highest possible value to you. Accunet makes it easy to get started as we offer many results-oriented services that allow you to see business results as you invest with us.
